BUSYLITTLEBEE LA MULOCHERE \_

FR-53270 TORCÉ-VIVIERS-EN-CHARNIE

**FRANCE** 

NAME/LABEL:

POWER AND GLORY DU CHEMIN DES KORRIGANS

**SPECIES:** DOG

**BREED:** AUSTRALIAN SHEPHERD

**SEX:** MALE

MICROCHIP NO.: 250268743111366

TATOO NO.: NOT PROVIDED PEDIGREE NO.: LOF 111204

## **GENETIC REPORT**

**SAMPLE:** BUCCAL SWAB

**SAMPLE TAKEN BY:** SYLVAIN BAUDRY, DVM

**REQUESTED TEST:** PROGRESSIVE RETINAL ATROPHY (PRA-PRCD)

**RESULT:** CLEAR (WT/WT)

## **COMMENT:**

The test examines presence or absence of PRCD gene mutation (c.5G>A) described as the cause of one form of progressive retinal atrophy (PRA) in several dog breeds. PRA-PRCD is a late onset disease characterized by progressive degeneration of retinal cells. PRCD gene defect is inherited as an autosomal recessive trait.

Regarding to the presence of tested mutation animals are classified in three groups:

- Clear (wt/wt) mutation is not present, normal genotype
- Carrier (mut/wt) one of two alleles carries tested mutation, disease is not clinically manifested
- Affected (mut/mut) both alleles carry tested mutation, disease is clinically manifested

For each group different breeding strategies should be followed. Breeding of affected and carrier animals should be avoided. If particularly valuable animal is classified as affected, it should be bred only with clear animal. In such case, all first generation siblings will be carriers. If a carrier is bred with clear animal, 50% of siblings are expected to be clear. In case two carriers are bred, 25% of siblings are expected to be clear and 50% are expected to be carriers. However, 25% of siblings are expected to be affected, therefore such breeding practice is discouraged.

**AUTHORIZED SIGNATURE:**

Results are valid for laboratory analysed samples only. Accuracy of the data about animal identity is the sole responsibility of the customer/owner. Laboratory is not responsible for false results which arise due to inaccurate animal identity data, false sample labels etc. To the extent the law allows, the maximal compensation for potential false result is limited to the invoiced amount. With the test it is not possible to rule out the presence of other genetic changes which might affect the development of the disease. Testing is performed according to the latest scientific knowledge.
